Explained: Leaf-spine data center network architecture. The old data center network design should make like a tree and leaf.. For many years, data center networks have been built in layers that, when diagrammed, suggest a hierarchical tree. As this hierarchy runs up against limitations, a new model is taking its place.. In the hierarchical tree data center, the bottom of the tree is the access ...

Data center network design moves from tree to leaf

Leaf-spine is a two-layer network topology composed of leaf switches and spine switches.. Leaf-spine is a two-layer data center network topology that's useful for data centers that experience more east-west network traffic than north-south traffic. The topology is composed of leaf switches (to which servers and storage connect) and spine switches (to which leaf switches connect).
